

# Evaluation Tables of the Energy Balance for Germany

Energy data for the years 1990 to 2023

Last update: September 2024 (final results up to 2022, provisional data for 2023)

## Content

### Preliminary notes and additional information

<b>1</b>	<b>Energy production, foreign trades, bunkers</b>
1.1	Primary energy production by energy sources
1.2	Import by energy source
1.3	Export by energy source
1.4	Net import by energy source
1.5	Bunkers on sea-going ships
<b>2</b>	<b>Energy consumption</b>
2.1	Primary energy consumption by energy source
2.2	Structure of energy consumption by sector
<b>3</b>	<b>Renewable energy sources</b>
3.1	Renewables' primary energy consumption
<b>4</b>	<b>Energy input for electricity generation</b>
4.1	Transformation input for electricity generation by energy source
4.2	Transformation input for district heating by energy source
<b>5</b>	<b>Combined heat and power (CHP)</b>
5.1	CHP plants: generation and energy input
5.2	Combined heat and power - Total
5.3	Combined heat and power - Main activity producers
5.4	Combined heat and power - Autoproducers
5.5	Combined heat and power - Other producers
<b>6</b>	<b>Final energy consumption</b>
6.1	Total final energy consumption by energy source
6.2	Final energy consumption by energy source: Mining and quarrying, manufacturing industry
6.3	Final energy consumption by energy source: private households
6.4	Final energy consumption by energy source: trade, commerce and services
6.5	Final energy consumption by energy source: agriculture, fishing, construction
6.6	Final energy consumption by energy source: transport
6.7	Final energy consumption: transport by sectors and selected energy sources
6.8	Final energy consumption: road transport by energy sources
<b>7</b>	<b>Energy efficiency</b>
7.1	Energy efficiency indicators
<b>8</b>	<b>Annex</b>
8.1	Classification of energy sources compared to the structure of the German Energy Balance

## **Preliminary notes on the evaluation tables of the German Energy Balance:**

This publication summarizes the most important data of the energy balances since 1990 in the form of aggregated time series. Especially for the reader, who is not interested in detailed energy balances of each year, we give a well-founded overview of the energy statistical development in Germany. It is to be considered, that the data for the most recent year are provisional.

Since 1995 the AG Energiebilanzen applies the physical energy content method for energy balances. This method assumes a 33 % efficiency of nuclear electricity generation, i.e. the input of primary energy is three times as high as the electricity generation. Electricity generation from renewable energy without fuel consumption (hydro, wind, photovoltaics) is calculated with 100 % efficiency. Until 1994 the primary energy consumption of these energy carriers was calculated by the average fuel input in conventional power plants (according to the former "substitution method"). However, all data in this publication are calculated by the physical energy content method.

The structure of this data collection is similar to the structure of the energy balances. It begins with primary energy production and foreign trade (section 1). Section 2 presents an overview of primary energy consumption by energy carriers and the structure of the energy consumption by sectors. The importance of renewable energy is illustrated in section 3. Section 4 shows the fuel input for electricity generation. Combined heat and power generation (CHP) is considered in more detail in section 5. Section 6 provides detailed tables on the development of the final energy consumption by energy carriers and sectors. Furthermore, section 7 illustrates the development of important energy efficiency indicators. In the annex, the classification of energy carriers considered in this publication is compared to the more detailed classification in the energy balances.

The following tables present also data that are not shown in this form in the energy balance. This is especially true for the presentation of CHP, a technology that concerns different energy conversion and consumption sectors of the energy balance. The fuel input for CHP electricity generation is shown in the conversion sector ("Public thermal power station", "Industrial power station" or "Hydro, wind, photovoltaic and other power stations"). However, the fuel input for CHP heat generation is shown in the conversion sector "Public cogeneration plants" only if it serves district heating. The fuel input for heat generation in CHP plants of the industry is included in the final energy consumption. The heat generated in these plants cannot be seen in the energy balance. The same applies to CHP plants of other auto-producers (less than 1 MW). Hence, the schema of the energy balance alone cannot show the full importance of CHP. Therefore, additional data on energy input and generation of heat and power in CHP plants are shown in section 5.

In 2023, the energy balances were subjected to a complete revision, starting with the year 2003 up to the current edge. All areas of the energy balance were carefully analyzed, new findings were incorporated and errors were corrected. Further information can be found in the infoplus information service of the AG Energiebilanzen, available at: <https://ag-energiebilanzen.de/presse/infoplus/>.

### **Additional information on the German Energy Balance:**

The evaluation tables were compiled on behalf of AG Energiebilanzen by

- **Energy Environment Forecast & Analysis (EEFA, [www.eefa.de](http://www.eefa.de)),**
- **Zentrum für Sonnenenergie- und Wasserstoff-Forschung Baden-Württemberg (ZSW, [www.zsw-bw.de](http://www.zsw-bw.de))**

The data are based on the published German Energy Balances (if not explicitly stated otherwise).

Commencing with the balance year 2018, the Federal Ministry for Economic Affairs and Energy stipulated in conjunction with the renewed assignment of the AG Energiebilanzen to prepare the energy balances for Germany that it incorporates the relevant data on renewables which are ascertained by the Working Group on Renewable Energies-Statistics (AGEE-Stat) under the auspices of the Federal Environment Agency (UBA) directly into the energy balances to be established by AGEB.

When it comes to renewables, AGEE-Stat had been an important data source for AGEB already in the past. The fact that original official statistics which could be adopted directly are generally not available for renewables prompts us to make individual estimates of the respective consumption values for whom it is often necessary to rely on specific in-house model calculations which have been specifically developed for this purpose. This applies to both AGEB and AGEE-Stat. It is therefore understandable that different approaches are taken by the model-based estimates of both institutions which do not necessarily lead to the same results.

Nevertheless, it seemed to be advisable to refer to a single data source in order to avoid any divergences which would be hard to explain to the public. When it comes to renewables, AGEE-Stat will, thus, be responsible for the respective data in the energy balance as well as in the requisite derivable evaluations starting with the balance year 2018. This already applies to the tabular information on renewable energy carriers included in this energy report.

1990 - 2022: final data; 2023: provisional data

PEC = Primary Energy Consumption, FEC = Final Energy Consumption

More detailed information on the development of energy efficiency indicators in Germany can be found in the publication:

"Ausgewählte Effizienzindikatoren zur Energiebilanz in Deutschland" (www.ag-energiebilanzen.de).

1) Sources: Destatis and Verkehr in Zahlen

2) 1 tonne-km is equivalent to 10 passenger-km.

3) Source: EEFA according to AGEb and DESTATIS

## 8.1 Classification of energy sources compared to the structure of the German Energy Balance

Evaluation tables	Energy Balance since 2000	Energy Balance 1995 to 1999	Energy Balance 1990 to 1994
Hard coal	Coal	Coal	Coal
	Briquettes	Briquettes	Coke
	Coke	Coke	Briquettes
	Other hard coal products	Other hard coal products	Crude tar Pitch Other hard coal products Crude benzene
Lignite	Coal	Coal	Coal
	Briquettes	Briquettes	Briquettes
	Other lignite products	Other lignite products	Coke
	Hard lignite	Hard lignite	Slack Hard lignite
Petroleum	Crude oil	Crude oil	Crude oil
	Motor gasoline	Motor gasoline	Motor gasoline
	Naphtha	Naphtha	Naphtha
	Jet fuel / kerosene	Jet fuel / kerosene	Aviation gasoline
	Diesel oil	Diesel oil	Jet fuel
	Fuel oil light	Fuel oil light	Diesel oil
	Fuel oil heavy	Fuel oil heavy	Fuel oil light
	Petroleum coke	Petroleum coke	Fuel oil heavy
	Liquified petroleum Gas	Liquified petroleum Gas	Petroleum coke
	Refinery gas	Refinery gas	Other petroleum products
Other petroleum products	Other petroleum products	Liquified petroleum Gas Refinery gas	
Gases	Coke oven and town gas	Coke oven and town gas	Coke oven gas
	Blast furnace and converter gas	Blast furnace and converter gas	Blast furnace gas
	Natural gas, Petroleum gas	Natural gas, Petroleum gas	Natural gas
	Mine gas	Mine gas	Petroleum gas Mine gas
Renewable energy sources	Hydro, wind and photovoltaics	Hydropower	Sewage gas
	Biomass und renew. wastes	Wind energy and photovoltaics	Hydropower
	Other renew. energy sources	Ren. wastes and other biomass Other renew. energy sources	Wood Peat Sewage sludge, ren. wastes
Other energy sources	non-renew. wastes, heat		Other energy sources
Electricity	Electricity	Electricity	Electricity
Nuclear energy	Nuclear energy	Nuclear energy	Nuclear energy
District heat	District heat	District heat	District heat
